AI Usage Log - Week 6 - Minh Nhat

Student: Nguyen Huyen Minh Nhat
Student ID: 105550225
Unit: COS40005 - Computing Technology Project A
Sprint 0: Weeks 1-6
Prepared: 21 October 2026
Team: Hanoi Group 5

This record explains how I used ChatGPT as a support tool for research, technical clarification, evidence review and debugging. The questions below are paraphrased by topic where an exact original prompt is not retained. I should supplement it with verbatim chat prompts if required by the unit.

Period	Questions / information I sought	How I used or checked the output
Weeks 1-4 - confirm dates	What research and evaluation methods would suit a human-only, AI-only and human-with-AI cybersecurity study? What risks should a Data Science evaluation consider?	Used as leads to organise research questions and identify topics to verify in papers, project documents and the individual research draft.
08 Oct 2026	How can precision, recall and F1 measure IOC extraction? What edge cases affect scoring, timing and AI over-reliance? How should the autonomous AI-only condition be distinguished from human trials?	Compared suggestions against the stated A/B/C protocol and the statistical-methodology document; separated proposals from completed experiment results.
12 Oct 2026	What data fields and SQLite constraints could record sessions, AI suggestions, Accept/Modify/Reject actions and final incident reports? Which local tests should check the design?	Used technical examples while developing the schema proposal; retained explicit constraints and identified unresolved integration contracts.
17 Oct 2026	Why does unittest fail when discovery is started from the tests folder? How do I rerun and interpret the local tests?	Changed to the repository-package root and reran tests. Checked the actual PowerShell output: 7/7 tests passed.
20 Oct 2026	How do the Week 6 contribution rubric, Jira worklogs and client feedback support an accurate individual summary? How should evidence be organised in GitHub?	Cross-checked Jira task assignments, time entries, meeting notes and screenshots before preparing this draft. No unverified integration or participant results were claimed.

Evidence and validation

Relevant checks include Jira SCRUM-45/SCRUM-49, a recorded local Python unittest run, the 20 October mentor meeting notes and the group feedback document. Seven local tests passed; they do not establish a completed deployed system or full research trial.

Statement to review before submitting

I used AI support for understanding concepts, exploring approaches, interpreting errors and organising evidence. I am responsible for reviewing and correcting AI-assisted content, explaining the design, and verifying any code or research claims. I will not present paraphrased questions as an exact prompt transcript.
