Week 4 - Group Feedback (Hanoi Group 5)

Ratings: Preparation 5 | Progress 4 | Evidence 4 | Technical 5 | Critical Thinking 4 | Communication 4 - **86/100 GREEN**

This Week

Focus: Research synthesis and initial plan review (end of Sprint 1).

Every member presented their research: project tooling (Jira, GitHub), a FastAPI architecture with evidence-grounded ATT&CK prompts, an evaluation method aligned with NIST AI RMF, a 10-table telemetry schema with passing tests, research on hallucination and automation bias, and a three-mode UI design. The research is strong and on schedule. The next step is to turn it into one working prototype.

What Went Well

- **Excellent preparation.** Each member shared their screen and showed real documents, tickets and a design preview.
- **Good project management.** Jira roadmap and GitHub repository are in place, and Sprint 1 is on track.
- **Evidence-grounded AI design.** Requiring every claim to cite evidence, checking ATT&CK technique IDs and retrying invalid JSON directly targets hallucination risk.
- **Measurable study design.** Precision, recall, F1 and investigation time, plus a telemetry schema that records how analysts respond to AI suggestions, fit the human vs AI research question well.
- **Early testing.** The telemetry schema already has 7 passing local tests.
- **Thoughtful UI.** Separating evidence, AI recommendations and analyst findings, with human-only, AI-only and combined modes, supports a fair comparison.

What Needs Improvement

- **Research is still siloed.** Each member understands their own part, but the team has not yet combined it into one document or one design.
- **No integrated prototype yet.** The front end, API and AI layer have not been connected.
- **Context limits are unmeasured.** Token size of real scenarios has not been checked against the chosen model's limit.
- **Reviews pending.** The methodology and schema still need team-lead review, and the tests only run locally.

> The goal is not simply to do more work. The goal is to turn the work into evidence that supports the project's research direction.

Next Priority

Primary objective: Turn the individual research into one working product: a front end and back end that run together, then wire in the AI.

By the next meeting, the team should:

- [ ] Combine all research into one document that the whole team understands
- [ ] Pair the UI owner with the API owner and get a working front end + back end
- [ ] Get an API key (OpenAI, Gemini or similar) and run at least one scenario through the prototype
- [ ] Measure the token size of the longest scenario on a public dataset against the model's context limit
- [ ] Finish the team-lead review of the methodology and telemetry schema

Evidence to Bring

Come prepared to **show**, not only describe, progress.

Useful evidence may include:

- Combined research document
- Architecture diagrams
- Code or repository changes
- A running prototype (UI + API) and one scenario result in structured JSON
- Telemetry records written to SQLite during a test investigation
- Token-count measurements
- Documented failed attempts

Mentor Feedback

Really good work. You have gone from students to working like engineers: you are managing tasks well, collecting data correctly and documenting clearly, and you are more prepared than most teams. The research and architecture are solid. Now it is time to take the idea and build an actual product. Start with a working front end and back end, wire in the AI with an API key, and if you build faster than expected, try a small custom model or a machine-learning layer as a stretch goal.

Next Meeting

Expected discussion: First integrated prototype (UI + API + AI via API key), combined research document and token-size results.

Key question:

> Run one scenario end to end: what does the analyst see in each of the three modes, and what telemetry does your database record?
